

Commander Decision Brief

Student: Nandini Chaurasiya

LaunchRoom report: [day-06-pressure-window/LaunchRoom - CareerForge Day 6.pdf at main · chaurasiyanandini379-gif/day-06-pressure-window](#)

REPO link: [chaurasiyanandini379-gif/day-06-pressure-window: A live launch incident is unfolding—customers are impacted, systems are unstable, and decisions have consequences. You must prioritize, communicate, and make engineering calls under time pressure instead of solving in comfort.](#)

1. Top Priority

What did you protect first?

I protected customer trust and payment integrity first.

Why?

Duplicate charge reports had the highest risk of long-term reputation damage. Losing customer trust during a live launch would have a greater impact than short-term revenue loss.

2. Second Priority

What mattered next?

Containing the technical source of duplicate processing through webhook idempotency and duplicate suppression.

Why did it come second?

After stabilizing customer impact, engineering effort had to focus on reducing repeated side effects that were amplifying failures across the system.

3. Intentional Deferral

What did you intentionally not solve during the pressure window?

I deferred analytics visibility improvements and complete inventory reconciliation.

Why was deferring it acceptable?

These issues were important but not immediately customer-facing. The priority was maintaining payment correctness and reducing active harm before addressing reporting accuracy.

4. Accepted Risk

What risk did you knowingly accept?

I accepted temporary revenue impact caused by refunds and transparent customer communication.

Why was that risk better than the alternative?

Protecting trust reduced the likelihood of chargebacks, public backlash, and long-term brand damage. Revenue could recover, but broken trust would be harder to rebuild.

5. Stakeholder Communication

Who needed communication first?

Customers and support teams required communication first.

What would you tell them?

"We are investigating payment inconsistencies affecting some orders. If duplicate charges occurred, eligible refunds will be processed. Our team is actively working on containment, and we will continue providing updates as more information becomes available."

6. Next 30-Minute Plan

1. Validate that webhook duplicate suppression is functioning correctly in production.
2. Reconcile payment and order records to identify all affected customers.
3. Coordinate customer support, finance, and engineering teams for recovery actions and post-incident review.

7. One Decision I Would Change

Which decision would you change?

I would initiate broader customer communication slightly earlier.

What would you do differently?

I would publish a transparent status update as soon as duplicate charge patterns became evident instead of waiting for additional confirmation.

What did you learn?

During incidents, timely communication reduces uncertainty and support pressure even when the full root cause is not yet known.

8. Final Command Rationale

My incident command approach focused on minimizing customer harm while maintaining operational stability. I prioritized trust over short-term revenue by addressing duplicate payment concerns quickly and communicating transparently. Engineering resources were directed toward reducing repeated failure patterns rather than cosmetic fixes. Lower-priority concerns such as analytics accuracy were intentionally deferred until the system was stabilized. Throughout the simulation, I balanced technical containment, stakeholder expectations, and business impact to make decisions under uncertainty. The experience reinforced that effective incident leadership requires clear priorities, controlled trade-offs, and decisive communication.
